

Capital Allocation Ranking September 19, 2026

A portfolio-aware ranking of the highest-priority researched investment choices, refreshed to Friday's official close, the new canonical retirement-portfolio-47.xlsx baseline, and the latest UBER re-underwrite.

portfolio-47.xlsx**

MARKET CUTOFF

Sep. 18 close

AS-OF DATE

Sat. Sep. 19, 2026

STATUS

**Validated - not
published**

Executive decision

The top of the ranking is stable, but the portfolio case for diversification strengthened. UBER remains the highest-priority tactical opportunity after today's fresh re-underwrite; GEHC remains the second clearest idiosyncratic dislocation; TSM stays the preferred direct semiconductor. VXUS, AVUV and AVDV remain the best portfolio-construction dollars because they reduce the opportunity cost of adding yet more U.S. mega-cap, financial and AI exposure.

PORTFOLIO VALUE	CASH	TOP 5	FINANCIAL/PAYMENTS	DIRECT SEMIS
\$1.680M	\$43,000	37.7%	23.2%	4.90%
Workbook 47 static value	2.56% of portfolio	Top 10: 55.8%	JPM + GS + MA + V + AXP	NVDA, AVGO, TSM, QCOM, ASML, SOXQ

Next-dollar sequencing: first prioritize UBER and GEHC where security-level asymmetry remains favorable; keep building strategic diversification through VXUS / AVUV / AVDV; use TSM as the preferred semiconductor add; and require better price or fresh evidence before adding materially to NVDA, ASML, AVGO, GEV or GRID.

Saturday note: U.S. markets are closed on September 19. "Current price" in this report therefore means the September 18 closing price. Portfolio weights and cost bases come only from the manifest-designated workbook; market prices were independently refreshed using Alpaca IEX daily bars.

What changed since the September 18 ranking?

Workbook 47 changes the marginal-dollar math

- UBER is now **15 shares / 0.063%**, still only a starter position.
- GEHC is **40 shares / 0.153%**; NVDA is **29 shares / 0.384%**.
- AVGO is now **2.49%**, increasing the portfolio-level cost of adding more AI infrastructure exposure.
- Direct semiconductor and semiconductor-ETF exposure is approximately **4.90%** before diversified-fund look-through.

Friday's close modestly widened dispersion

- TSM, NVDA, ASML and AVGO finished above the prior intraday snapshot, reducing immediate entry urgency.
- UBER, ADBE, QCOM and LMT closed modestly below the prior snapshot.
- VRTX also weakened modestly and is not currently held, improving its relative portfolio fit.
- The macro hurdle remains elevated: the 10-year Treasury stayed around the 5% threshold and crude oil remained near/above \$100.

Ranking change: VRTX moves from #10 to #8. NVDA slips from #8 to #9, LOW rises to #10, and ASML moves from #9 to #11. This is not a thesis downgrade for NVDA or ASML; it reflects Friday's higher closing prices plus the increased semiconductor weight in workbook 47.

Capital allocation ranking

The ordering balances expected return at the current price, company quality, downside asymmetry, portfolio fit and the diversification value of the marginal dollar. It is a next-dollar priority list, not a ranking of business quality alone.

#	Ticker	Rank change	Sep. 18 close	vs. prior snapshot	Workbook wt.	Tier	Current posture	Why it ranks here
1	UBER	unchanged	\$70.50	-0.3%	0.063%	Priority capital	Staged accumulation	Fresh Sep. 19 re-underwrite strengthens the setup: current price is well below the ~\$90 probability-weighted illustrative value, while the position is still only a starter. Core FCF scaling is working; AV capital intensity is the key risk.
2	GEHC	unchanged	\$64.13	-0.2%	0.153%	Priority capital	Staged add	Still one of the clearest valuation dislocations in the researched universe. Healthcare diversification is useful and position size is small, but PCS losses, cash conversion and M&A discipline remain gating items.
3	TSM	unchanged	\$433.52	+0.7%	0.569%	Priority capital	Stage, do not chase	Best direct semiconductor blend of quality, growth and valuation in the research set. Friday strength reduced near-term margin of safety slightly; geopolitical concentration remains the binding risk.
4	VXUS	unchanged	\$85.88	+0.1%	2.663%	Priority capital	Systematic additions	The portfolio remains U.S.-heavy. VXUS is the cleanest broad geographic diversifier, though the current level argues for recurring tranches rather than a large single entry.
5	AVUV	unchanged	\$121.94	+0.2%	1.706%	Priority capital	Add on weakness	Adds U.S. small-value/profitability exposure that is underrepresented in the current book. Higher long rates increase financing sensitivity, so price discipline matters.
6	AVDV	unchanged	\$111.02	+0.0%	Not held	Priority capital	Gradual initiation	Adds international small-value/profitability exposure without increasing AI-stack concentration. Strong portfolio-construction value even without a single-name catalyst.
7	ADBE	unchanged	\$248.87	-0.2%	Not held	Priority capital	Selective initiation	Valuation compression has created a more compelling FCF setup in a high-quality software franchise. The central diligence question is whether generative AI strengthens monetization or erodes seat economics.
8	VRTX	up 2	\$508.29	-0.4%	Not held	Selective capital	Selective initiation	Moves up because it adds differentiated healthcare growth while NVDA and ASML closed higher. CF durability and pipeline optionality are attractive; pipeline concentration and valuation remain the principal constraints.
9	NVDA	down 1	\$222.04	+1.2%	0.384%	Selective capital	Small tranches only	Operating quality remains exceptional, but the position has grown to 29 shares and Friday closed above the prior snapshot. Prior work still shows materially better asymmetry below roughly \$205.
10	LOW	up 1	\$192.50	+0.2%	Not held	Selective capital	Selective initiation	A lower valuation and housing-recovery optionality support the setup. Mortgage rates and housing turnover remain the timing variables, so the opportunity is attractive but not urgent.
11	ASML	down 2	\$1,679.25	+1.7%	0.200%	Selective capital	Wait for pullback / stage	Unique lithography moat and High-NA adoption remain intact, but Friday strength pushed the stock farther from the preferred entry zone. Tiny portfolio weight is supportive; valuation and cycle sensitivity are not.
12	CRM	unchanged	\$237.91	-0.1%	1.402%	Selective capital	Selective add	Recent weakness has improved valuation support, but the existing position and broader software exposure reduce the incremental benefit of the next dollar.
13	UNH	unchanged	\$376.94	+0.2%	1.127%	Selective capital	Selective add	Normalized earnings power and healthcare diversification remain attractive. Medical-cost trends, regulatory scrutiny and execution uncertainty justify staged sizing.
14	PANW	unchanged	\$363.57	+0.2%	Not held	Selective capital	Watch / add on weakness	Elite cybersecurity franchise and no current position improve portfolio fit. Duration sensitivity and premium valuation keep entry discipline important in a >5% 10-year environment.
15	AVGO	unchanged	\$357.74	+0.7%	2.491%	Attractive / gated	Add only on weakness	Excellent franchise, but Friday closed higher and the position is already 2.49%. Direct and look-through AI/semiconductor concentration makes this a lower-utility next dollar despite strong long-term fundamentals.
16	AXP	unchanged	\$311.80	-0.1%	1.855%	Attractive / gated	Hold / wait	Fundamentals remain constructive, but the portfolio has roughly 23.2% in JPM, GS, MA, V and AXP combined. Concentration, not company quality, is the main constraint.
17	QCOM	unchanged	\$178.01	-0.5%	1.105%	Attractive / gated	Opportunistic only	Friday weakness improves valuation, but the stock remains near/above the workbook fair-value reference and adds to an already meaningful semiconductor sleeve.
18	VIS	unchanged	\$325.61	+0.2%	0.310%	Attractive / gated	Conditional add	Broad industrial diversification is useful and current weight is small, but current pricing remains above the preferred accumulation zone.
19	LMT	unchanged	\$533.59	-0.3%	Not held	Attractive / gated	Selective watch	Defense backlog and cash flows diversify the portfolio, but expected return is solid rather than exceptional relative to higher-ranked dislocations.
20	GEV	unchanged	\$940.01	+0.2%	1.847%	Wait / monitor	Wait for better entry	The business thesis strengthened in the Sep. 18 re-underwrite, but price is essentially at the ~\$935 base case and ~\$951 scenario-weighted value. Prior work identified materially better value around \$850-\$875.
21	GRID	unchanged	\$178.17	+0.1%	0.637%	Wait / monitor	Opportunistic only	The secular grid/electrification thesis remains excellent, but valuation is above the preferred add zone. Useful satellite exposure, but not a priority at this price.

Highest-priority opportunities

1. UBER - best tactical asymmetry

The Sep. 19 re-underwrite estimates an illustrative probability-weighted value around **\$90** versus a \$70.50 close, with a \$55 bear / \$93 base / \$120 bull framework. The core business continues to show strong bookings growth, operating leverage and FCF conversion. The position is only 0.063%, leaving room for staged construction. The reason not to be aggressive is AV: more than \$10B of expected commitments raises capital-return and disintermediation risk.

2. GEHC - undervaluation with execution gates

At \$64.13, GEHC still offers a meaningful valuation gap to prior scenario work while adding healthcare diversification. The position remains small enough that portfolio fit is favorable. The required proof points are PCS repair, stronger cash conversion, backlog conversion and disciplined M&A.

3. TSM - preferred direct semiconductor

TSM retains the strongest blend of process leadership, AI/HPC demand, scale economics and valuation among the semiconductor choices in the researched universe. The stock closed at \$433.52, above the prior intraday snapshot, so staging is preferable. Taiwan geopolitical risk remains the non-diversifiable thesis risk.

4-6. VXUS / AVUV / AVDV - strategic diversifiers

These are less about a near-term catalyst and more about improving the portfolio's expected-return mix. VXUS broadens geographic exposure, AVUV adds U.S. small-value/profitability, and AVDV adds international small-value/profitability. Their ranking stays high because the portfolio remains concentrated in U.S. large-cap financial, payment and technology exposures.

7. ADBE - quality at a reset valuation

Adobe offers a high-margin, cash-generative software franchise at a materially reset valuation and is not currently held. The opportunity hinges on generative AI proving additive to Creative Cloud / Acrobat monetization rather than structurally eroding seat value or competitive differentiation.

8. VRTX - diversification improves relative rank

VRTX moves up because it supplies high-quality healthcare growth without adding to the portfolio's dominant factor exposures. The stock's modest Friday decline improves relative entry value. The principal risks are pipeline concentration and the valuation assigned to assets beyond the cystic-fibrosis franchise.

Why the AI / power names are not higher

NVDA

Outstanding operating thesis, but Friday closed at \$222.04 and the direct position increased to 29 shares. Prior underwriting still shows a better margin of safety below roughly \$205. Additions should be smaller than they would be at lower prices.

AVGO / ASML

Both remain high-quality strategic assets. The issue is marginal utility: AVGO is already 2.49% of the portfolio and ASML closed at \$1,679.25 after a strong Friday. Their franchises are more attractive than their next-dollar urgency.

GEV / GRID

The power and grid thesis remains structurally strong. GEV is near its latest base/scenario values, while GRID is above the preferred add zone. Better entry prices would move both materially higher without requiring a change in the underlying thesis.

Implementation framework

Priority capital

UBER, GEHC, TSM, VXUS, AVUV, AVDV and ADBE. These have the best combination of expected return, strategic fit and current-price support. Use staged entries rather than treating the ranking as a one-day trade list.

Selective capital	VRTX, NVDA, LOW, ASML, CRM, UNH and PANW. All are investable under the current research view, but either valuation, existing exposure or a specific execution checkpoint reduces urgency.
Attractive but gated	AVGO, AXP, QCOM, VIS and LMT. The main constraint is portfolio concentration or a less compelling current-price expected return, not necessarily weak company quality.
Wait / monitor	GEV and GRID. Both are structurally attractive themes, but current prices do not compensate enough for valuation and rate risk relative to higher-ranked alternatives.

What could change the ranking quickly?

Move higher

- NVDA below roughly \$205 without a thesis break.
- GEV into roughly the \$850-\$875 zone with backlog and margin evidence intact.
- GRID returning to the preferred accumulation zone.
- ASML / AVGO pullbacks without estimate deterioration.
- Further evidence that UBER's AV capital commitments earn attractive returns through third-party financing and platform economics.

Move lower

- 10-year yields sustaining materially above 5% with no offsetting earnings revisions.
- UBER AV commitments accelerating while platform economics deteriorate.
- GEHC PCS / FCF execution missing the current checkpoints.
- Further semiconductor additions elsewhere in the portfolio, raising concentration even if company-level theses remain intact.
- A significant oil / inflation shock that pushes the Fed toward a more restrictive path.

Methodology and sources

Research mode: Comparison Research under the Portfolio Agent Equity Research workflow. The September 18 ranking was used as the prior underwriting baseline, and unchanged company background was not rebuilt. The refresh concentrates on new portfolio state, official closing prices, the Sep. 19 UBER re-underwrite and the current macro hurdle.

1. **Canonical portfolio source:** retirement-portfolio-47.xlsx, manifest-designated September 19, 2026; SHA-256 17e4ce3c878c05330dbb97d52ddb50d95f513e076800e32be051cc67f75420c9.
2. **Prior comparison report:** Retirement_Portfolio_Research_Universe_Ranking_2026-09-18.
3. **Fresh company research:** UBER_Equity_Research_Reunderwrite_2026-09-19; GEV_Refresh_Reunderwrite_2026-09-18; AVGO_Refresh_Reunderwrite_2026-09-16 and other existing project underwriting referenced by the prior comparison report.
4. **Market prices:** Alpaca IEX daily bars for September 18, 2026, retrieved September 19 while the market was closed. IEX is used as a current-price cross-check; portfolio weights remain workbook-derived.
5. **Macro cross-check:** Reuters, September 18, 2026 market wrap and oil-market coverage; 10-year Treasury yields remained around the 5% threshold and oil near/above \$100.

Research caveat: This ranking prioritizes the marginal dollar based on current research and portfolio composition. It does not replace the Portfolio CIO's authoritative thesis statuses, and it should be refreshed when prices move materially, a new earnings report arrives, or the canonical workbook changes.

Prepared for portfolio research use. Prices and market conditions can change after the stated cutoff. Valuation scenarios are analyst judgments and should be interpreted with their stated assumptions and thesis-break conditions. This report is validated for review and has not been published to the Portfolio Command Center.
